

Ideation Phase

Brainstorm & Idea Prioritization

Date	15 August 2026
Team ID	
Project Name	Employee Raise Issue – Record Producer & Service Portal Integration
Maximum Marks	4 Marks

Step-1: Problem Identification and Solution Direction

Problem Analysis

The project focuses on workplace-related issues commonly faced by employees in large enterprise organizations, including payroll discrepancies, access problems, infrastructure requests, and HR policy clarifications. The existing approach of raising such issues through emails or informal communication channels can create challenges in managing the issues effectively.

The major challenges identified are:

- Lack of standardized data capture.
- Delayed issue resolution.
- No visibility into the status of raised issues.
- Increased manual effort for HR and support teams.
- Inconsistent prioritization and assignment of issues.

Selected Problem Statement

In a large enterprise organization, employees frequently face workplace-related issues such as payroll discrepancies, access problems, infrastructure requests, or HR policy clarifications. When these issues are raised through emails or informal communication channels, organizations face difficulties in capturing standardized information, tracking issue status, prioritizing requests, and assigning them consistently to the appropriate teams.

Therefore, there is a need for a centralized and standardized solution that enables employees to easily raise workplace-related issues while providing structured data capture, appropriate validations, dependency handling, and better management of the resulting issues.

Selected Solution Direction

ServiceNow was selected as the platform for implementing the solution. The proposed approach is to configure an **Employee Raise Issue – Record Producer & Service Portal Integration** that allows employees to raise an Employee Issue through the Service Portal using a Record Producer.

The solution should:

1. Enable employees to raise an **Employee Issue** from the Service Portal.
2. Use a **Record Producer** instead of exposing the custom table directly to employees.
3. Capture relevant employee issue information in a standardized manner.
4. Enforce required validations and field dependencies.
5. Provide a structured mechanism for creating and managing Employee Issue records.
6. Provide an implementation aligned with ServiceNow configuration and best practices.

Step-2: Brainstorm, Idea Listing and Grouping

Brainstormed Ideas

To address the identified problem, the following solution ideas were considered:

1. Email-Based Issue Submission

- Provide a standardized email format for employees to report issues.
- Reduce unstructured information compared with informal emails.

2. Direct Custom Table Form

- Allow employees to create Employee Issue records directly from the ServiceNow table.
- Provide structured fields for capturing issue information.

3. Service Catalog Item

- Create a Service Catalog Item through which employees can submit workplace-related issues.
- Provide a guided and standardized submission experience.

4. Record Producer Integrated with Service Portal

- Provide an employee-friendly form through a Record Producer.
- Create Employee Issue records directly in the custom table.
- Capture standardized information while hiding unnecessary table-level details from employees.

5. Automated Categorization and Assignment

- Use category and subcategory information to structure issue classification.
- Use appropriate ServiceNow platform capabilities to support consistent routing and assignment.

6. Validation and Dependency Controls

- Apply validations to ensure required information is captured.
- Make dependent fields such as **Subcategory** respond appropriately to the selected **Category**.

Grouping of Ideas

Group	Ideas
Issue Submission	Email-based submission, Direct custom table form, Service Catalog Item, Record Producer
Data Standardization	Structured fields, Mandatory information, Validation controls
Issue Classification	Category, Subcategory, Dependency between fields
Issue Management	Assignment, Prioritization, State tracking
User Experience	Service Portal, Employee-friendly submission interface

Shortlisted Direction

After grouping the ideas, the **Record Producer integrated with the Service Portal** was identified as the most suitable solution direction because it combines an employee-friendly submission experience with structured record creation in ServiceNow.

The selected approach also supports **validation, field dependencies, categorization, state management, and other ServiceNow configurations** required for the Employee Issue process.

Step-3: Idea Prioritization

The shortlisted ideas were evaluated based on **Importance** and **Feasibility**. Importance represents how effectively an idea addresses the identified employee issue-management problems, while Feasibility represents how practical the idea is to implement using the available ServiceNow platform capabilities.

Idea	Importance	Feasibility	Priority
Email-Based Issue Submission	Medium	High	Medium
Direct Custom Table Form	High	High	High
Service Catalog Item	High	High	High
Record Producer Integrated with Service Portal	High	High	Highest
Automated Categorization and Assignment	High	Medium	High
Validation and Dependency Controls	High	High	High

Prioritization Decision

The **Record Producer integrated with the Service Portal** was given the highest priority because it provides a structured and employee-friendly mechanism for submitting workplace-related issues while remaining practical to implement using ServiceNow platform capabilities.

The approach avoids exposing the custom Employee Issue table directly to employees and provides a controlled submission experience. It also supports the use of standardized fields, validations, and dependencies required by the project.

Validation and dependency controls were also given high priority because they help ensure that the information submitted by employees is consistent and meaningful.

Automated categorization and assignment were considered important but comparatively less feasible within the scope of the project because it would require additional automation beyond the core implementation.

Therefore, the final solution direction selected for development was:

ServiceNow Employee Raise Issue – Record Producer & Service Portal Integration
