

Project Design Phase-II

Data Flow Diagram & User Stories

Date	15 August 2026
Team ID	
Project Name	Employee Raise Issue – Record Producer & Service Portal Integration
Maximum Marks	4 Marks

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

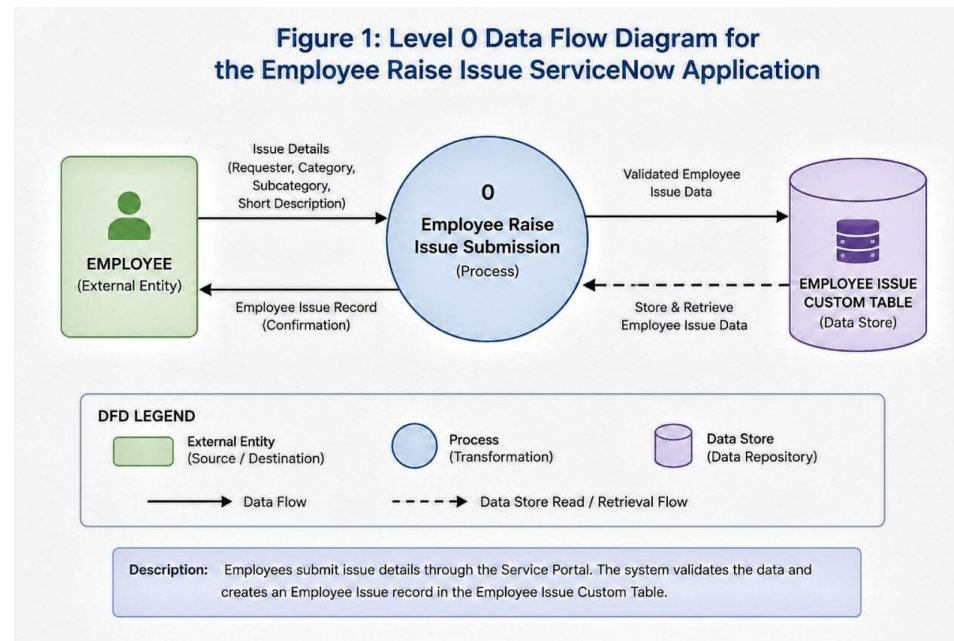

Figure 1: Level 0 Data Flow Diagram for the Employee Raise Issue ServiceNow Application

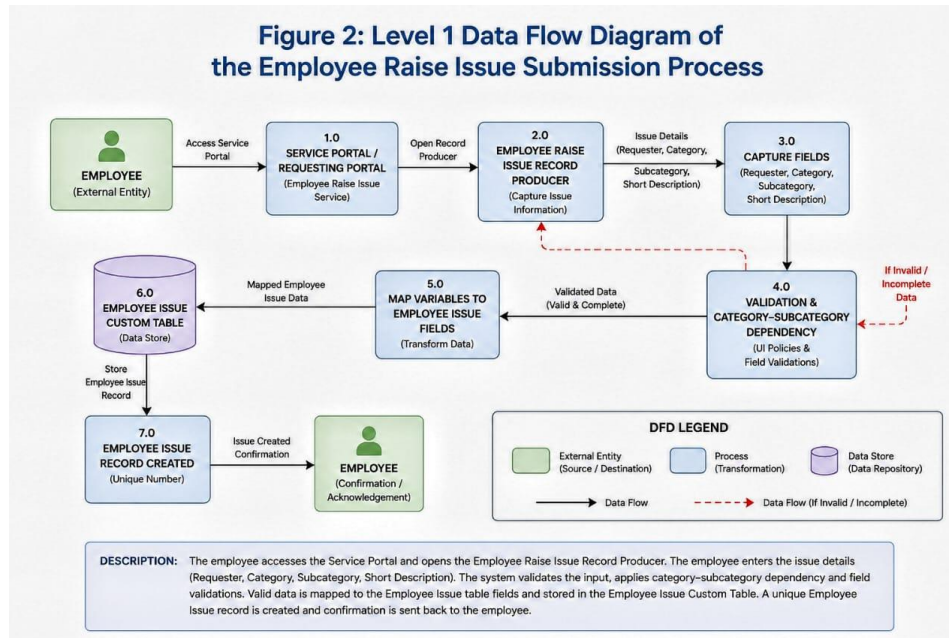

Figure 2: Level 1 Data Flow Diagram of the Employee Raise Issue Submission Process

User Stories:

The following user stories define the functional requirements and expected behaviour of the Employee Raise Issue ServiceNow application from the perspective of employees and administrators.

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Employee	Service Portal Access	USN-1	As an employee, I want to access the Employee Raise Issue service from the Service Portal so that I can raise a workplace-related issue through a centralized interface.	The Employee Raise Issue service is accessible from the Requesting Portal and opens the configured Record Producer.	High	Sprint-3

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Employee	Issue Information Capture	USN-2	As an employee, I want to provide my requester information so that the issue is associated with the appropriate employee.	The Requester field allows the employee to select a valid user, and the selected value is transferred to the created Employee Issue record.	High	Sprint-3
Employee	Issue Classification	USN-3	As an employee, I want to select a Category and corresponding Subcategory so that my workplace issue can be classified appropriately.	The Subcategory options are controlled according to the selected Category, and an appropriate combination can be selected before submission.	High	Sprint-3
Employee	Issue Description	USN-4	As an employee, I want to provide a Short Description so that the support team can understand the purpose of my issue.	The Short Description field accepts the issue description and becomes mandatory when the configured State is New.	High	Sprint-3
Employee	Issue Submission	USN-5	As an employee, I want to submit my completed issue form so that my workplace issue is registered in ServiceNow.	A valid submission is accepted and creates an Employee Issue record in the custom table.	High	Sprint-3
Administrator	Record Producer Mapping	USN-6	As an administrator, I want Record Producer variables to map to the Employee Issue table fields so that submitted information is stored correctly.	Values entered or selected through the Record Producer are transferred to their corresponding Employee Issue fields.	High	Sprint-3
Administrator	Validation and Field Control	USN-7	As an administrator, I want validation and field-control rules to be applied so that incomplete or inappropriate information is controlled before submission.	Configured UI Policies and field restrictions are applied correctly, including the mandatory Short Description behaviour when State is New.	High	Sprint-3
Administrator	Employee Issue Management	USN-8	As an administrator, I want submitted issues to be stored as structured Employee Issue records so that they can be managed within ServiceNow.	A submitted issue creates a uniquely numbered Employee Issue record containing the corresponding requester, category, subcategory, description, state, priority, and assignment information as configured.	High	Sprint-4
