

Project Design Phase-II
Technology Stack (Architecture & Stack)

Date	15 August 2026
Team ID	
Project Name	Employee Raise Issue – Record Producer & Service Portal Integration
Maximum Marks	4 Marks

Technical Architecture:

The Deliverable shall include the architectural diagram as below and the information as per the table1 & table 2

Technical Architecture for the Employee Raise Issue ServiceNow Application

The solution is implemented within the ServiceNow platform. Employees interact with the application through the Service Portal, where the Employee Raise Issue Record Producer provides the submission interface. Record Producer variables capture the required issue information and map it to the Employee Issue custom table. ServiceNow configuration controls such as UI Policies and Category–Subcategory dependency are used to validate and control the submitted information.

The application does not use separate third-party APIs, external machine learning models, or a separate database server. Data is stored within the ServiceNow platform's database layer.

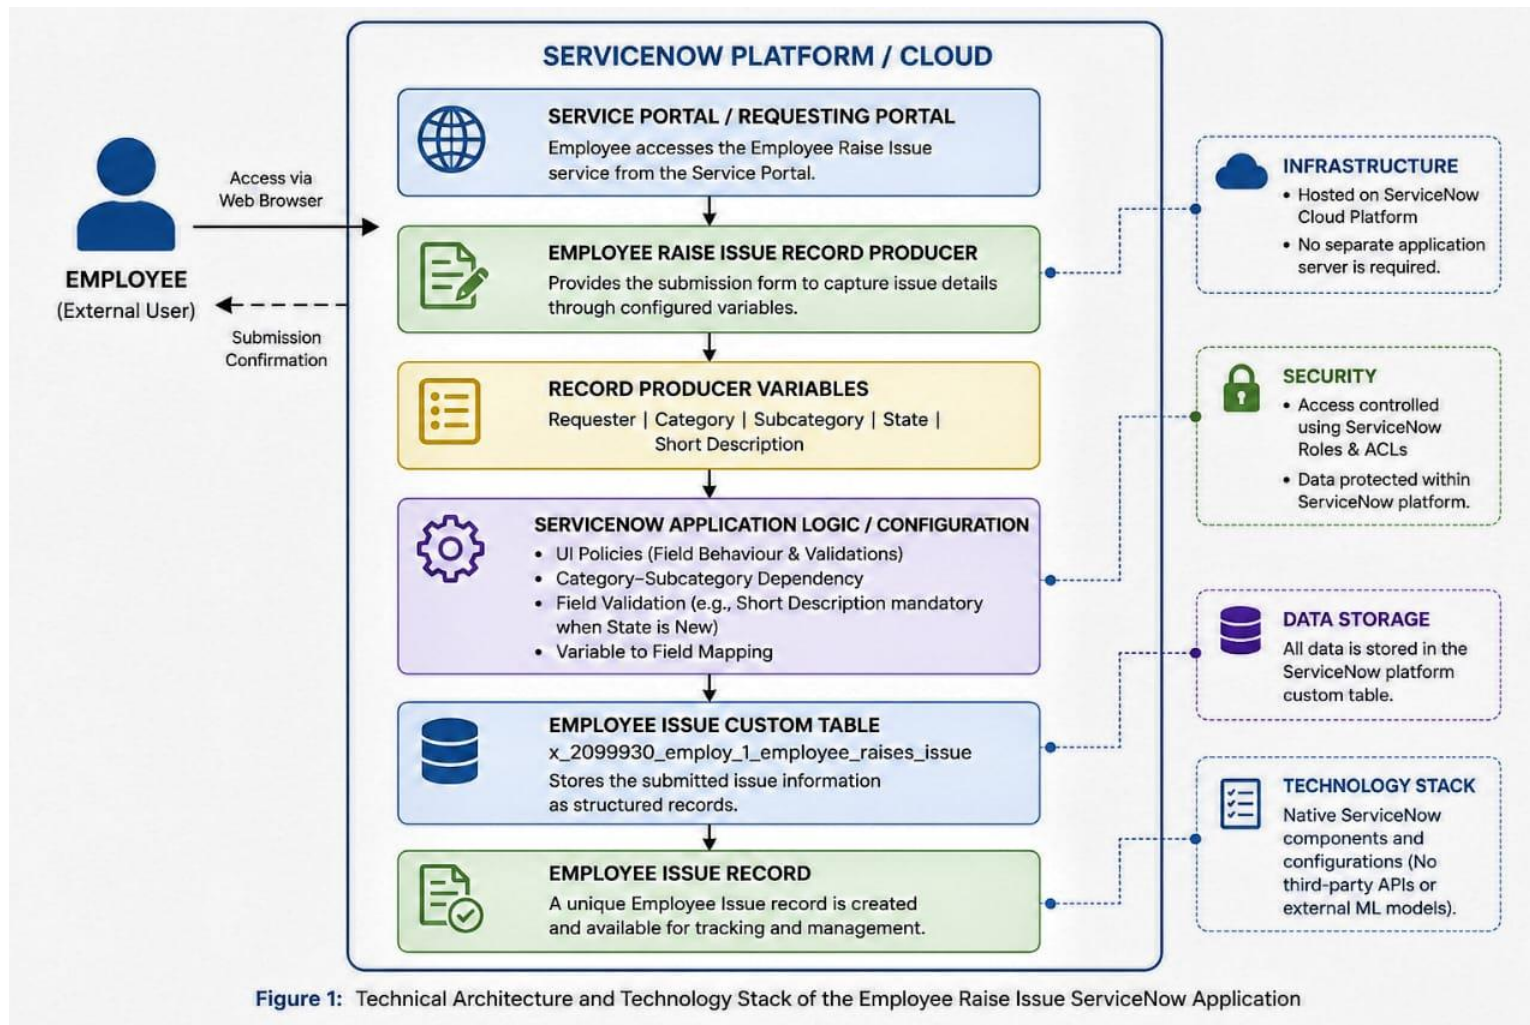

Table-1: Components & Technologies:

S.No	Component	Description	Technology
1.	User Interface	Employee-facing interface used to access and submit the Employee Raise Issue request.	ServiceNow Service Portal / Requesting Portal
2.	Application Logic-1	Provides the structured Employee Issue submission interface and creates records in the target table.	ServiceNow Record Producer
3.	Application Logic-2	Controls field behaviour and validation based on configured conditions.	ServiceNow UI Policies
4.	Application Logic-3	Controls the relationship between Category and Subcategory and maps submitted variables to target fields.	ServiceNow Variable Configuration & Field Mapping
5.	Database	Stores Employee Issue records and their associated field information.	ServiceNow Platform Data Layer / Custom Table
6.	Cloud Database	No separate cloud database is used; application data is stored within the ServiceNow platform.	ServiceNow Platform Data Layer
7.	File Storage	No dedicated external file-storage service is required for the core Employee Issue submission process.	ServiceNow Platform
8.	External API-1	No external API is used by the Employee Raise Issue submission process.	Not Applicable
9.	External API-2	No external API is used by the Employee Raise Issue submission process.	Not Applicable
10.	Machine Learning Model	No machine learning model is used in the Employee Raise Issue application.	Not Applicable
11.	Infrastructure (Server / Cloud)	The application is hosted and executed on the ServiceNow cloud platform. No separate application server is configured for this project.	ServiceNow Cloud Platform

Table-2: Application Characteristics:

S.No	Characteristics	Description	Technology
1	Open-Source Frameworks	No separate open-source framework is used. The application is configured using native ServiceNow platform capabilities.	ServiceNow Platform
2	Security Implementations	Access to the application and records is controlled through ServiceNow platform permissions, roles, and configured access controls.	ServiceNow Roles / ACL-based Platform Security
3	Scalable Architecture	The solution uses a centralized ServiceNow platform and can be extended by adding categories, subcategories, fields, validations, and additional employee service processes without creating a separate application server.	ServiceNow Platform / Configuration
4	Availability	The application is available through the ServiceNow Service Portal when the ServiceNow platform is available to authorized users. No separate load-balancing infrastructure is configured in this project.	ServiceNow Cloud Platform
5	Performance	The solution uses native ServiceNow components and a lightweight Record Producer submission flow. No separate application server, external API calls, or additional processing layer is required for the core submission process.	ServiceNow Service Portal / Record Producer
