

Project Design Phase Solution Architecture

Date	15 August 2026
Team ID	
Project Name	Employee Raise Issue – Record Producer & Service Portal Integration
Maximum Marks	4 Marks

Solution Architecture

Introduction

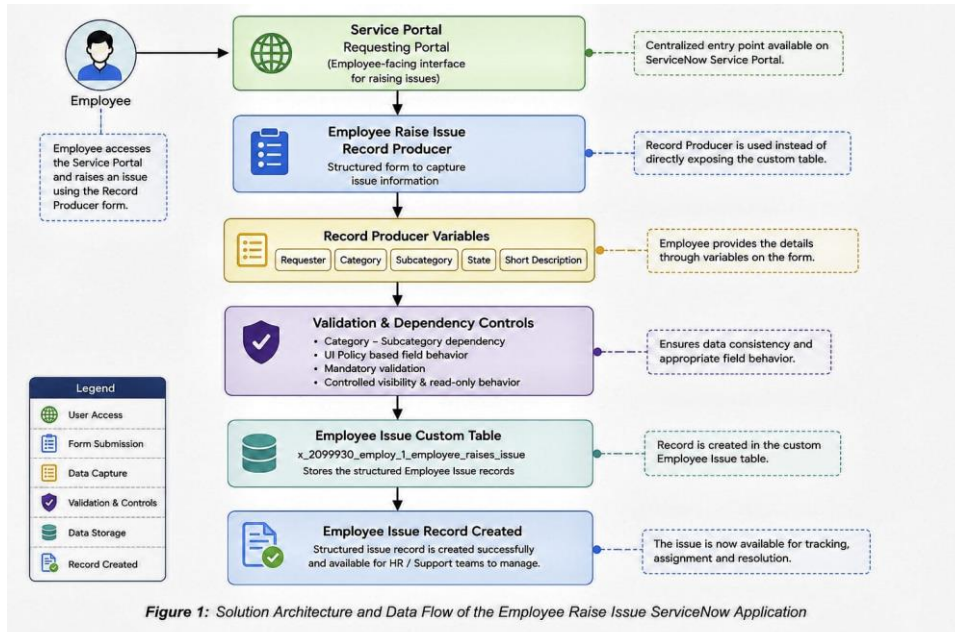

The proposed solution architecture defines how employees interact with the ServiceNow Service Portal to raise workplace-related issues and how the submitted information is converted into structured Employee Issue records.

The architecture uses a **Service Portal**, **Record Producer**, **mapped variables**, **validation and dependency controls**, and a **custom Employee Issue table** to provide a standardized issue-submission process.

Architecture Objectives

The solution architecture is designed to:

- Provide employees with a centralized interface for raising workplace-related issues.
- Use a **Record Producer** instead of exposing the custom Employee Issue table directly.
- Capture employee issue information through structured variables.
- Map Record Producer variables to corresponding fields in the Employee Issue table.
- Enforce field behaviour, validation, and Category–Subcategory dependency.
- Create a structured Employee Issue record in ServiceNow after submission.

Architecture Components

1. Employee

The employee is the primary user of the solution. The employee accesses the Service Portal and provides the required information about the workplace-related issue.

2. Service Portal

The Service Portal provides the employee-facing interface through which the **Raise Employee Issue** service can be accessed.

It provides a centralized and user-friendly entry point without requiring employees to access the underlying custom table directly.

3. Record Producer

The **Employee Raise Issue Record Producer** provides the structured submission form.

It collects information such as:

- Requester
- Category
- Subcategory
- State
- Short Description

The Record Producer creates an Employee Issue record in the target custom table when the employee submits the form.

4. Record Producer Variables

The variables capture information entered or selected by the employee.

The variables are mapped to the corresponding fields of the Employee Issue table so that the submitted information is transferred into the created record.

5. Validation and Dependency Controls

ServiceNow configuration controls are used to maintain data consistency.

These include:

- Category and Subcategory dependency.
- UI Policy-based field behaviour.
- Mandatory validation where required.
- Controlled visibility and read-only behaviour for applicable fields.

6. Employee Issue Custom Table

The submitted information is stored as a record in the custom Employee Issue table:

x_2099930_employ_1_employee_raises_issue

The table contains the structured information required to manage the employee issue.

7. Employee Issue Record

After successful submission, ServiceNow creates an Employee Issue record containing the information captured through the Record Producer.

End-to-End Data Flow

The overall flow of the solution is:

Employee → Service Portal → Record Producer → Variables → Validation & Dependency Controls → Employee Issue Custom Table → Employee Issue Record

This architecture separates the **employee-facing submission experience** from the underlying data table while maintaining structured and controlled record creation.
